MCP

- Choosing the Right Primitive
  - Here's a quick decision guide:

    -> Need to give Claude new capabilities? Use tools

    -> Need to get data into your app for UI or context? Use resources

    -> Want to create predefined workflows for users? Use prompts
- PROMPTS
  - Prompts in MCP servers let you define pre-built, high-quality instructions that clients can use instead of writing their own prompts from scratch .
- MIME TYPE
  - used in Resources .
    we can return any type of data like : Json , Binary , Plain text , to give client a hint of what data we are returning we define MIME type inside resources decorator
- Resources
  - Direct Resource:
    For Static Files.
    Does not contain any parameter in URI(Uniform Resource Identifier)
  - Templated Resource:
    For Dynamic resources.
    Does contain parameter in URL(Uniform Resource Identifier)
- MCP has Insceptor
  - Use : [mcp dev file_name.py]
    - This starts a development server and gives you a local URL, typically something like http://127.0.0.1:6274. Open this URL in your browser to access the MCP Inspector.
- WORKFLOW
  - 
- Not Traditional Tool
- No need to Define Schema seperately
- Can be connect to any LLM or Server
- Can Have Multiple Tools , Resources , Prompts
- Mcp Client is the communication Between Our Server and Mcp server
- Mcp Client will be our access point to all the tools implemented by mcp server
- MCP is Transport Agnostic
  - Communication btw client and server can done over many different protocols:
    can connect using HTTP or Websockets, etc.
- List tools Request call is done between MCP Client and MCP Server .
